

CustomerIQ

Retention Evidence & Case Study Library

Real-world retention strategies, reported results, and their application to CustomerIQ

Purpose: This document forms the marketing-evidence layer of CustomerIQ. Case studies are operational precedents, not ML training data or guarantees of future results.

Case Study Index

#	Company	Strategy	Reported result
1	Upday	Reactivation	528,000 lapsed users reactivated; 4.9% engagement increase
2	Blacklane	RFM + lifecycle	94% CRM revenue increase; 194% lifecycle conversion improvement
3	Rappi	WhatsApp win-back	80% increase in purchasers vs control; 28%/43% reactivation lifts
4	Panera Bread	Personalization + loyalty	5% retention lift among at-risk guests; 2× loyalty redemptions
5	Jumbo Interactive	Behavioral onboarding	18% new-user retention increase; 16% ARPU lift
6	Showmax	Lifecycle + content personalization	204% subscriber increase; 71% retention; 12% win-back increase
7	LES MILLS+	Predictive churn intervention	53% of predicted-to-churn customers retained; 80% annual conversion
8	Musora	Reason-based cancellation save	Conversion 3% → 6.5%; 35 hours/week saved
9	Coches	Lifecycle + reactivation	2,892% increase in monthly reactivated users; 2,400% conversion growth with email+push

1 — Upday

Industry: Media & entertainment

Customer problem / context: Reactivate users with no app session for 30 days using push notifications.

Reported result: 528,000 lapsed users reactivated; 4.9% increase in engagement among targeted users.

CustomerIQ connection: CustomerIQ signal: long recency / inactivity. Potential action: trigger a win-back message after a business-specific inactivity threshold. The 30-day threshold is not universal.

Evidence quality: HIGH for most cases; LES MILLS+ and Musora are MEDIUM-HIGH. These are primarily vendor-published customer stories, so methodology and causal attribution may be limited.

Source: Braze — Upday Reactivates 528K Lapsed Users With Push Notifications (2022).

2 — Blacklane

Industry: Travel & on-demand mobility

Customer problem / context: Use RFM, lifecycle stage, engagement, booking status and preferences to create differentiated journeys.

Reported result: 94% increase in CRM revenue; 194% improvement in lifecycle conversion; 32% email open-rate improvement; 33% push-open improvement.

CustomerIQ connection: CustomerIQ signal: recency + frequency + monetary value + lifecycle. Potential action: treat high-value/high-risk and lapsed customers differently rather than using one generic retention message.

Evidence quality: HIGH for most cases; LES MILLS+ and Musora are MEDIUM-HIGH. These are primarily vendor-published customer stories, so methodology and causal attribution may be limited.

Source: Braze — Blacklane lifecycle case study (2022).

3 — Rappi

Industry: Food delivery & marketplace

Customer problem / context: Segment active vs lapsed users and add personalized WhatsApp deals alongside existing channels.

Reported result: 80% increase in users making a purchase vs control; 28% lift in one-purchase reactivation; 43% lift in 2+ purchases within 30 days.

CustomerIQ connection: CustomerIQ signal: lapsed status and purchase inactivity. Potential action: test personalized messaging-app win-back where consent and economics support it.

Evidence quality: HIGH for most cases; LES MILLS+ and Musora are MEDIUM-HIGH. These are primarily vendor-published customer stories, so methodology and causal attribution may be limited.

Source: Braze — Rappi Reactivates Lapsed Users With WhatsApp (2023).

4 — Panera Bread

Industry: Restaurant / retail

Customer problem / context: Use behavioral decisioning, browsing, abandonment, preferences, loyalty and daypart to personalize offers.

Reported result: 5% retention lift among at-risk guests; 2× loyalty offer redemptions; 2× purchase conversion from abandoned-order follow-ups; 50+ hours manual work saved.

CustomerIQ connection: CustomerIQ signal: abandoned browse/order, product affinity, loyalty and risk. Potential action: recommend relevant products/rewards instead of generic discounts.

Evidence quality: HIGH for most cases; LES MILLS+ and Musora are MEDIUM-HIGH. These are primarily vendor-published customer stories, so methodology and causal attribution may be limited.

Source: Braze — Panera Bread retention during menu transformation (2025).

5 — Jumbo Interactive / Oz Lotteries

Industry: Digital lottery & gaming

Customer problem / context: Personalize onboarding using first-purchase behavior and automated behavioral journeys.

Reported result: 18% increase in new-user retention; 16% lift in average revenue per active user; 6% increase in app installs.

CustomerIQ connection: CustomerIQ signal: early value and engagement. Potential action: intervene during onboarding before mature churn risk appears.

Evidence quality: HIGH for most cases; LES MILLS+ and Musora are MEDIUM-HIGH. These are primarily vendor-published customer stories, so methodology and causal attribution may be limited.

Source: Braze — Jumbo Increases New User Retention by 18% (2022).

6 — Showmax

Industry: Subscription streaming

Customer problem / context: Segment by lifecycle, viewing history, content preferences, dormant status and subscription attributes.

Reported result: 204% increase in subscribers; 71% retention rate; 12% increase in win-back rate; 19% dormant-viewer activation; 37% ROI increase.

CustomerIQ connection: CustomerIQ signal: declining engagement, long recency, content affinity and lifecycle. Potential action: recommend relevant content and lifecycle-specific messaging.

Evidence quality: HIGH for most cases; LES MILLS+ and Musora are MEDIUM-HIGH. These are primarily vendor-published customer stories, so methodology and causal attribution may be limited.

Source: Braze — Showmax smart segmentation case study (2021).

7 — LES MILLS+

Industry: Digital fitness subscription

Customer problem / context: Connect a custom churn-risk model to personalized annual-membership offers and automated journeys.

Reported result: 53% of customers predicted to churn were retained; 80% of targeted at-risk customers converted to annual memberships; rollout time reduced 35%.

CustomerIQ connection: CustomerIQ signal: predicted churn + renewal exposure + declining usage. Potential action: connect risk scoring to a specific, testable retention intervention.

Evidence quality: HIGH for most cases; LES MILLS+ and Musora are MEDIUM-HIGH. These are primarily vendor-published customer stories, so methodology and causal attribution may be limited.

Source: Customer.io — LES MILLS+ churn intervention case study (2024).

8 — Musora

Industry: Online music education / subscription

Customer problem / context: Capture cancellation reasons and route customers into reason-specific save journeys.

Reported result: Re-engagement conversion increased from 3% to 6.5%; 35 person-hours saved per week; 10× more real-time data processed.

CustomerIQ connection: CustomerIQ signal: cancellation intent + stated reason. Potential action: recommend pause, plan change, support, education or offer based on the reason.

Evidence quality: HIGH for most cases; LES MILLS+ and Musora are MEDIUM-HIGH. These are primarily vendor-published customer stories, so methodology and causal attribution may be limited.

Source: Customer.io — How Musora Combats Churn (2025).

9 — Coches

Industry: Automotive marketplace

Customer problem / context: Use onboarding progress, last activity, search behavior, viewed cars and preferred channel for personalized journeys.

Reported result: 352% increase in monthly ad replies; 533% increase in ads published; 2,892% increase in monthly reactivated users; 2,400% conversion growth with email + push.

CustomerIQ connection: CustomerIQ signal: long recency, incomplete onboarding, product intent and channel preference. Potential action: follow up based on the customer's latest behavior and preferred channel.

Evidence quality: HIGH for most cases; LES MILLS+ and Musora are MEDIUM-HIGH. These are primarily vendor-published customer stories, so methodology and causal attribution may be limited.

CustomerIQ Evidence-Layer Synthesis

- 1. Inactivity → reactivation:** Upday, Rappi, Coches and Showmax show practical use of lapse/recency signals for win-back.
- 2. Risk + value:** Blacklane demonstrates why recency, frequency and monetary value can be combined with lifecycle stage.
- 3. Behavioral personalization:** Panera, Showmax and Coches use what customers do—browsing, viewing, search, abandonment and preferences—not only demographics.
- 4. Cancellation reason:** Musora shows that customer-provided reasons can guide the intervention beyond a churn score.
- 5. Lifecycle matters:** Jumbo, Showmax and Blacklane distinguish onboarding, active use, lapse, cancellation and loyalty.
- 6. Predictive risk needs activation:** LES MILLS+ is a direct precedent for connecting a churn model to a concrete retention journey.
- 7. Channel orchestration:** Rappi, Panera, Coches and Blacklane demonstrate multi-channel approaches, but CustomerIQ should account for consent, preference and economics.

Recommended architecture

Customer behavior → churn probability → risk segment → revenue exposure → marketing intelligence → relevant evidence → potential strategy → experiment/holdout.

Critical rule: Case studies remain separate from ML training. They support explainable recommendations and strategy hypotheses; they do not prove that an intervention will work for a specific CustomerIQ customer.

Measurement rule: Before scaling recommendations, test incremental impact with a holdout/control group whenever feasible.

Evidence limitations

The library notes that many sources do not disclose randomized assignment, absolute sample sizes, baseline rates, incremental profit, long-term retention, model calibration, or complete holdout methodology. Reported results should therefore be treated as directional evidence and operational precedent.

Primary source links are preserved in the original evidence library from which this PDF was generated.
